## Utah Climate and Water Report

The purpose of the Climate and Water Report is to provide a snapshot of current and immediate past climatic conditions and other information useful to agricultural and water user interests in Utah. The report utilizes data from several sources that represent specific parameters (streamflow data from the United States Geological Survey, reservoir data from the Bureau of Reclamation, and other sources), geography including high elevation United States Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS) Snowpack Telemetry (SNOTEL) data, and agriculturally important data from the USDA-NRCS Soil Climate Analysis Network (SCAN). Data on precipitation, soil moisture, soil temperature, reservoir storage, and streamflow are analyzed and presented. These data analyses can be used to increase irrigation efficiency and agricultural production. As with all data and analyses, there are limitations due to data quality, quantity, and spatial application.

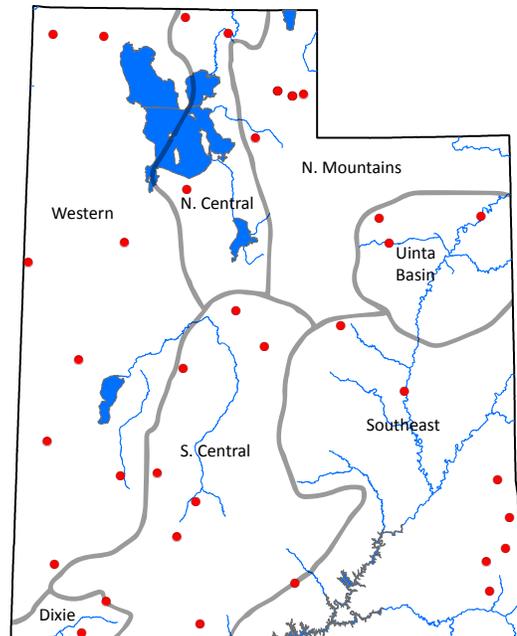

### SNOTEL

- Mountainous areas
- High elevation (>6,000 ft)
- Water supply forecasting
- Installed where snow pack represents the water supply

### SCAN

- Agricultural and range lands
- Mid elevation (3 – 7,000 ft).
- Irrigation efficiency and rangeland productivity
- Installed on spatially representative soils

## Utah General Summary

### December 1, 2018

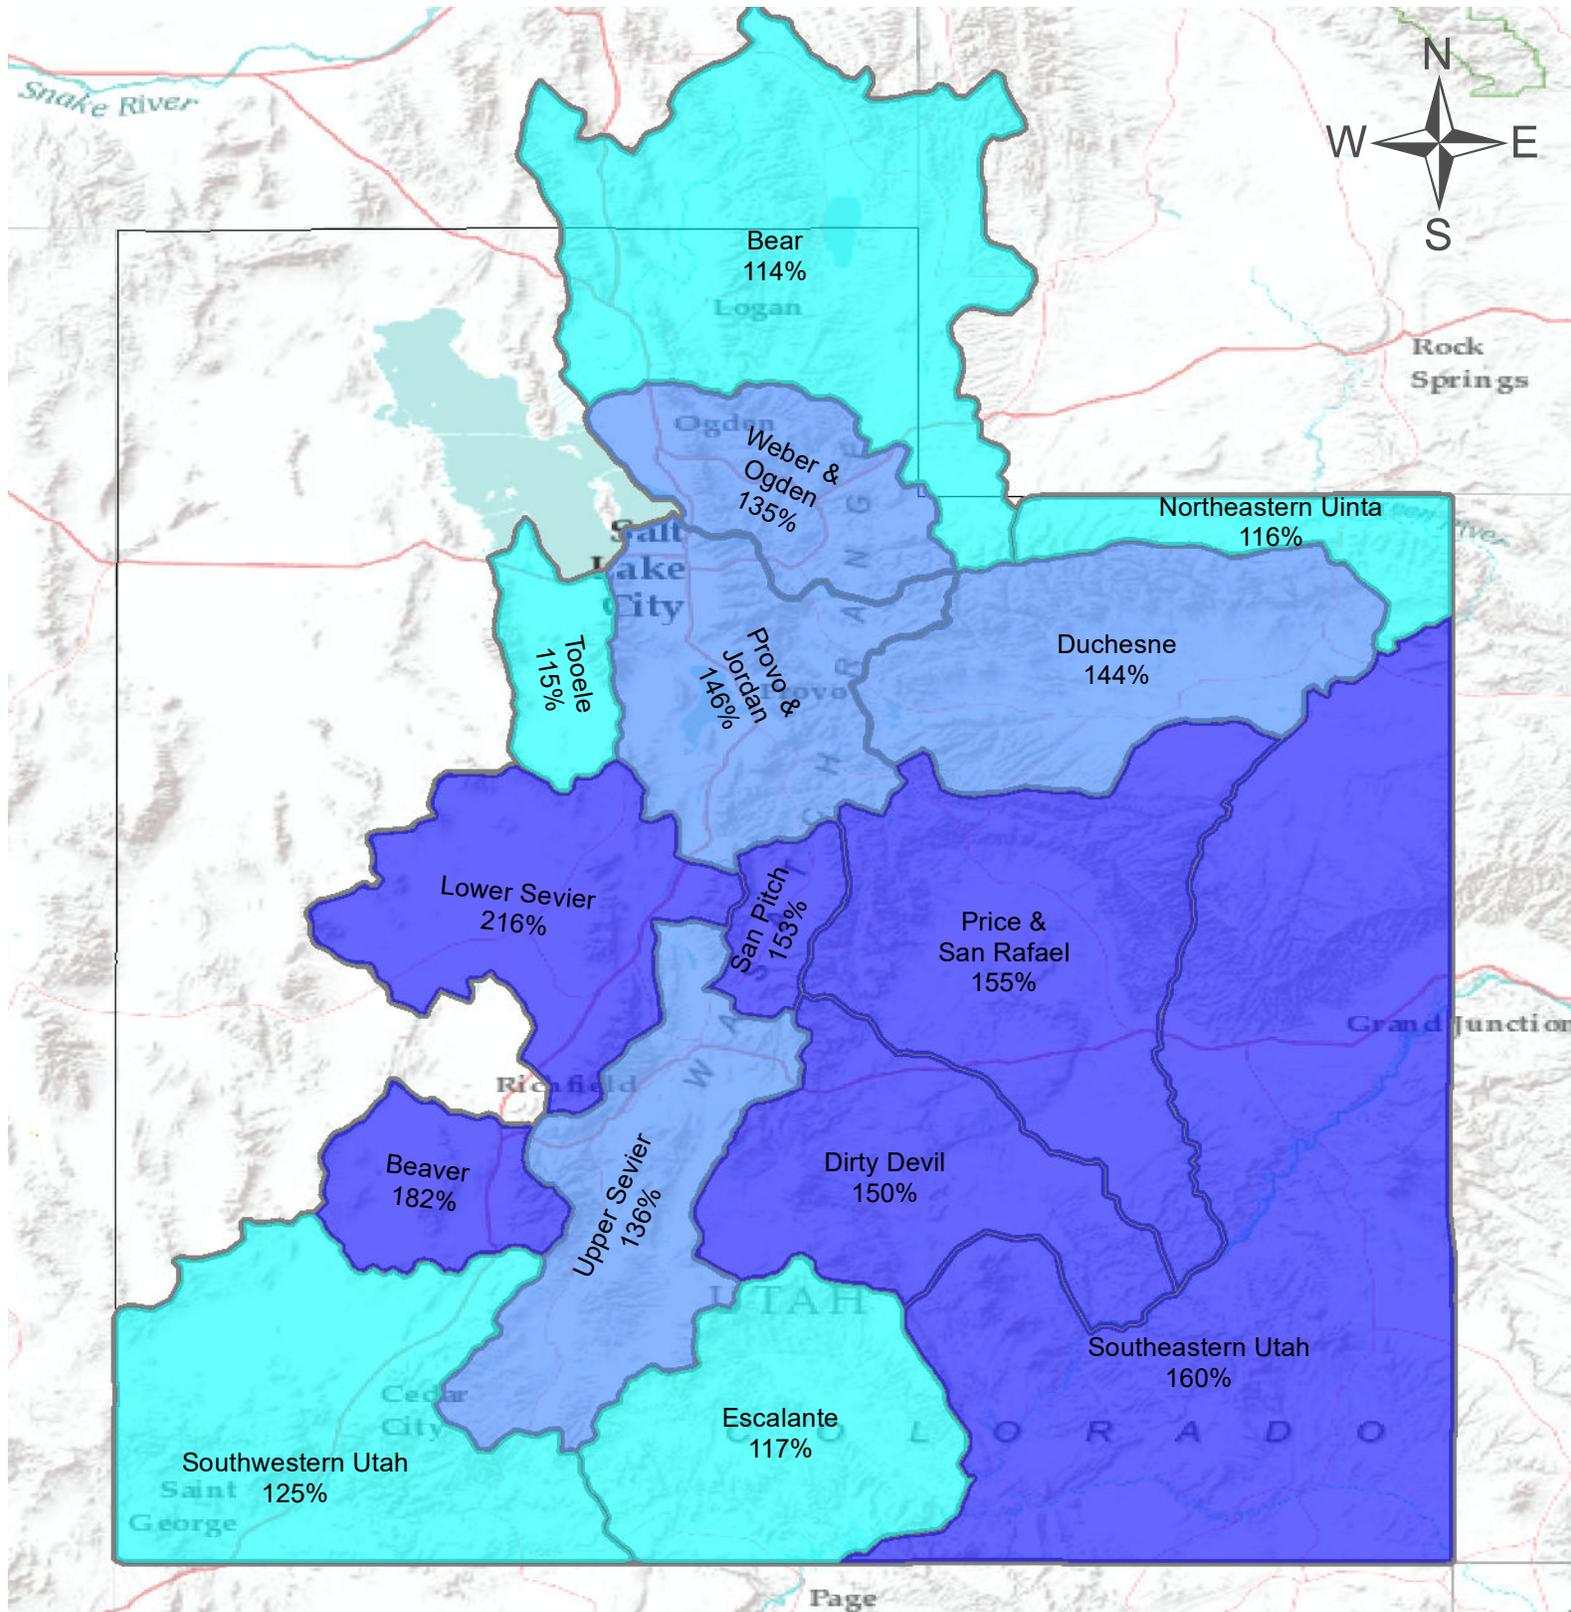

*This report has been reorganized to better reflect two distinct geographic areas being monitored – the low elevation valley sites (**Soil Climate Analysis Network**) that are critical for agricultural production and operations, and the high elevation mountainous areas where water supply is generated (**SNOWTElemetry**). Most of the graphs have been updated to utilize daily data versus the old monthly bar charts so that the timing and distribution of precipitation and other events can be seen. The timing distribution of precipitation can be as important as the overall amount in an agricultural context. These graphs are hyperlinked so that the user can simply click on the graph and be taken to the most recent version on the Snow Survey web page. Questions, comments and suggestions are welcome and should be directed to [troy.brosten@ut.usda.gov](mailto:troy.brosten@ut.usda.gov).*

### **Current Valley Conditions (SCAN)**

The 2019 water year's good momentum continued at a slower pace through November in Utah's Valley locations, with an average of 0.7 inches of precipitation. This brings the average state total precipitation to an above-average 3.3 inches. Unfortunately, the region needing it the most, Southeastern Utah, got the least amount of precipitation at a scant 0.3 inches. Because of this, the area persists in a Severe to Exceptional Drought (D2-D4). Overall, however, the state's soil moisture conditions are near normal and generally better than last year, which would have been unthinkable just three months ago. Soil and air temperatures are trending near normal to slightly below normal, like last month.

### **Current Mountain Conditions (SNOTEL)**

The first three weeks in November were uneventful, but then Thanksgiving week arrived, and the skies finally opened up. Multiple storms over several days added up to roughly three inches of precipitation across the state, bringing the December 1 seasonal accumulation (Oct-Nov) to 135% of average. Several basins are off to a particularly good start to the new water year: the Beaver and Lower Sevier watersheds are at around 200% of average precipitation, with the Provo, Duchesne, Price-San Rafael, Dirty Devil, Southeastern Utah, and San Pitch basins not too far behind at closer to 150% of average. The snowpack in Utah's mountains is also above average- largely due to the recent wave of storms. Current statewide conditions are 127% of normal for this time of year, led by the San Pitch watershed at 149%. The recent storms increased Utah's snow water equivalent by several inches in some areas. However, it's still very early in the snow accumulation season and way too soon to know whether this winter will provide boom, bust, or average snow totals. Soil moisture levels dropped to 44% compared to 60% last month due to the dry period during the first half of November. Now that snow is on the ground, soil moisture levels will not likely change much until the spring snowmelt, and the dry soils may result in reduced runoff efficiency. Reservoir storage is currently at 55% of capacity, compared to 71% last year. Combined with below-average streamflow levels, these explain the low water availability index (WAI) values published in this report. Water managers have reason to be hopeful about this winter's snowpack, but it will take above-average precipitation totals to start to replenish water storage levels.

# SCAN portion of report

# Statewide SCAN

December 1, 2018

The average precipitation at SCAN sites within Utah was 0.7 inches in November, which brings the seasonal accumulation (Oct-Nov) to 3.3 inches. Soil moisture is at 36% compared to 31% last year.

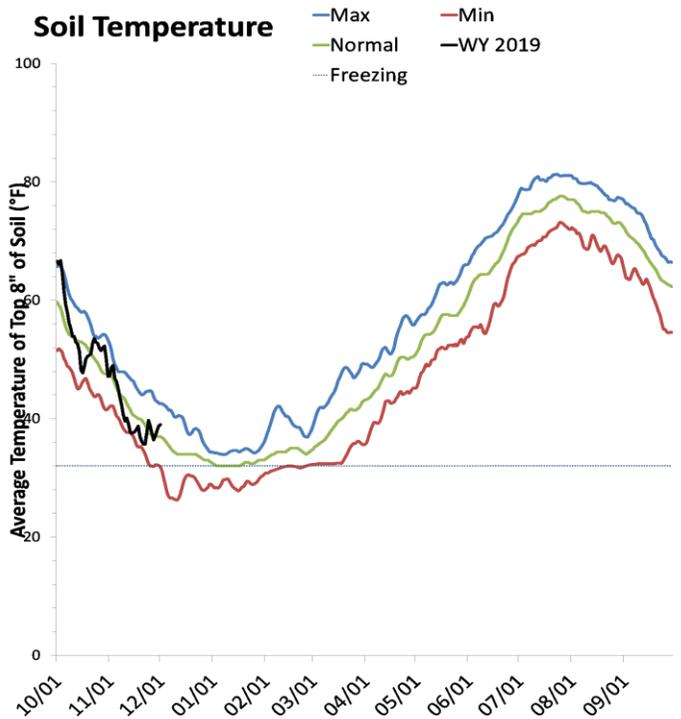

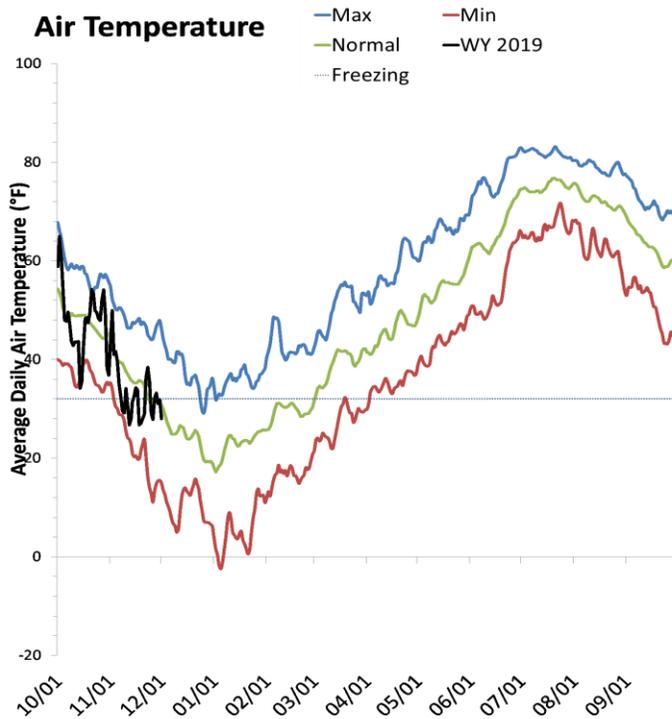

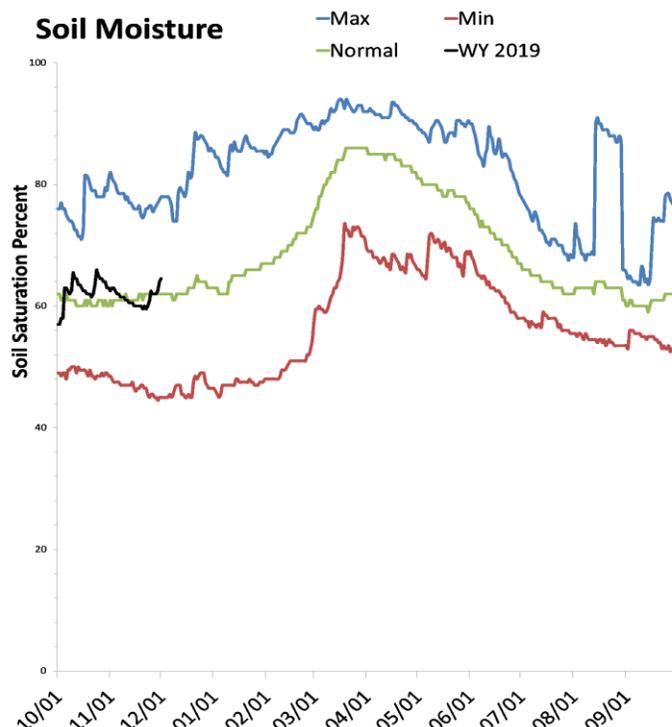

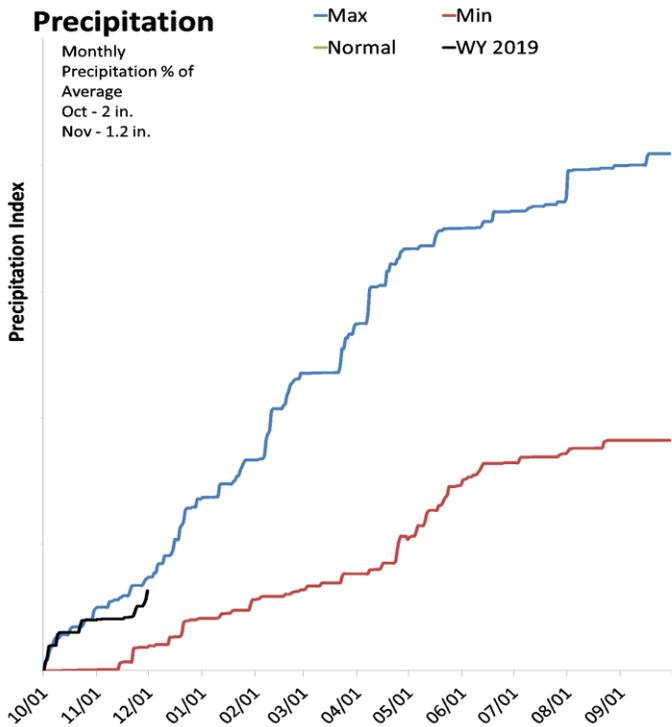

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

# North Central

December 1, 2018

The average precipitation in November at SCAN sites within the basin was 1.2 inches, which brings the seasonal accumulation (Oct-Nov) to 3.2 inches. Soil moisture is at 64% compared to 74% last year.

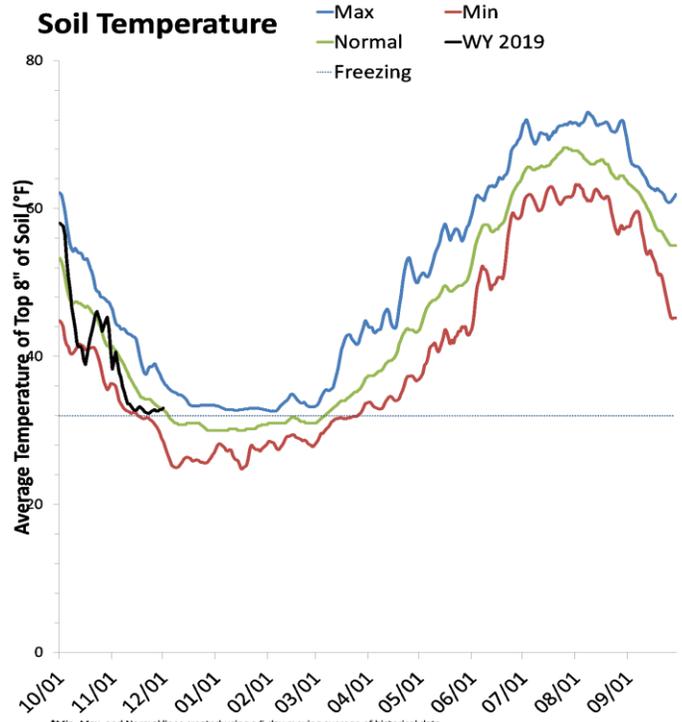

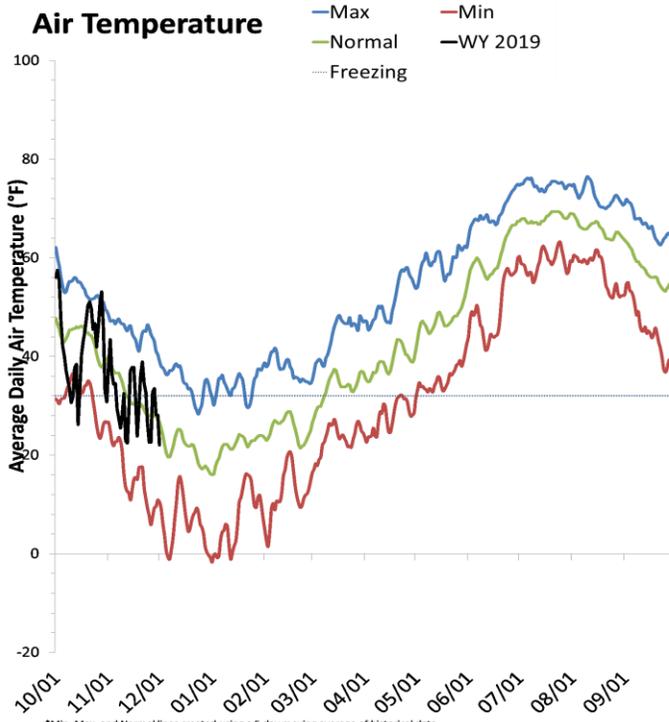

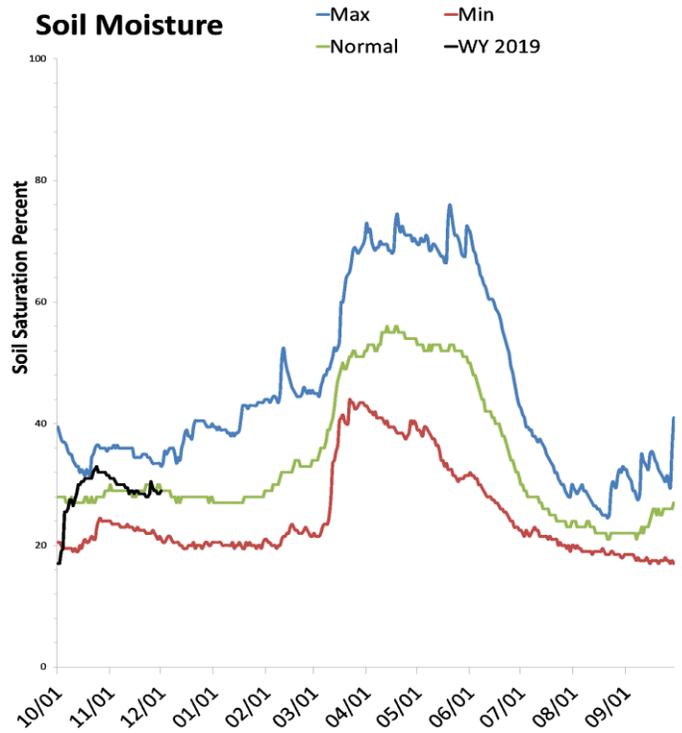

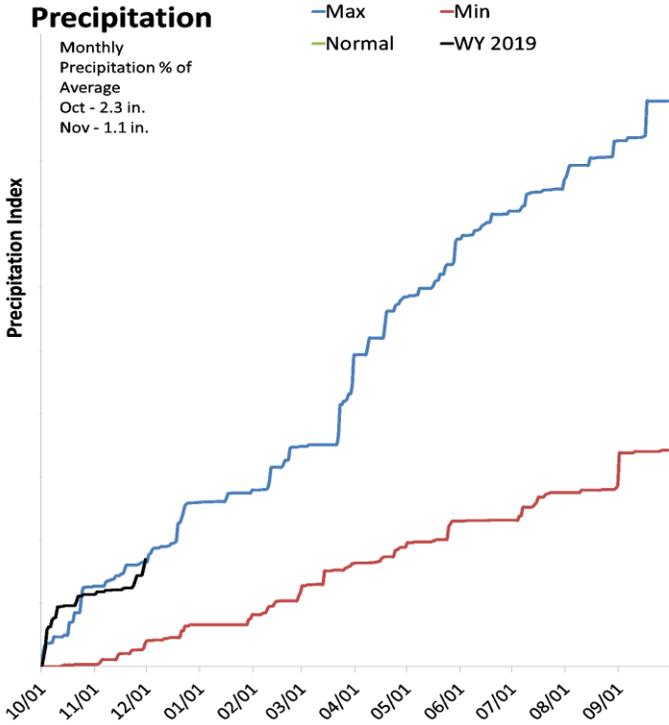

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

# Northern Mountains

December 1, 2018

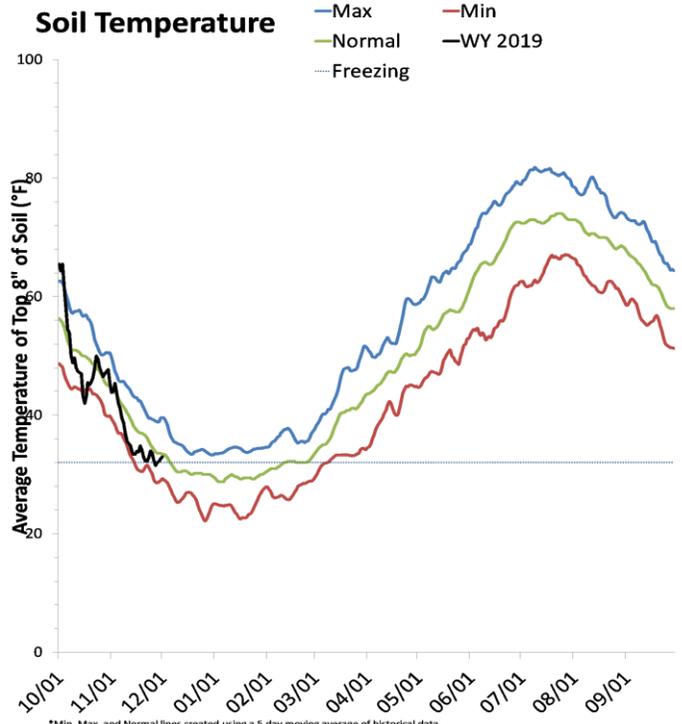

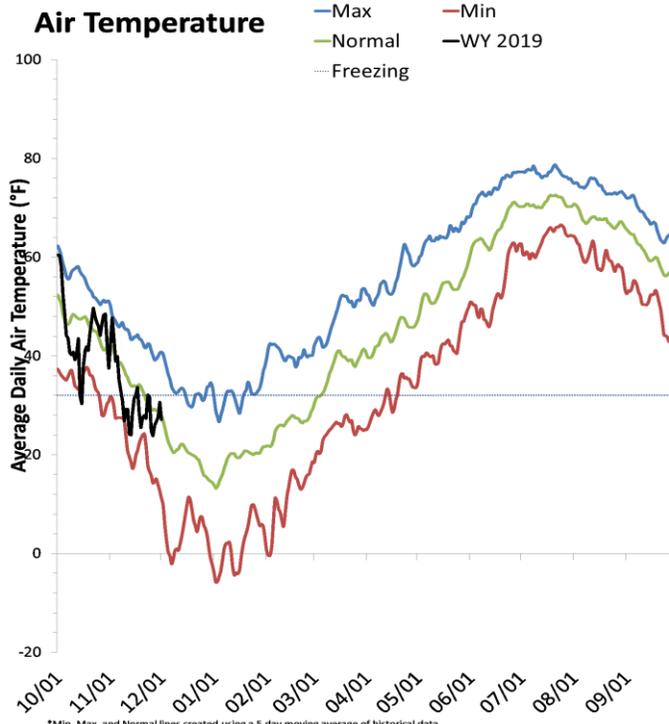

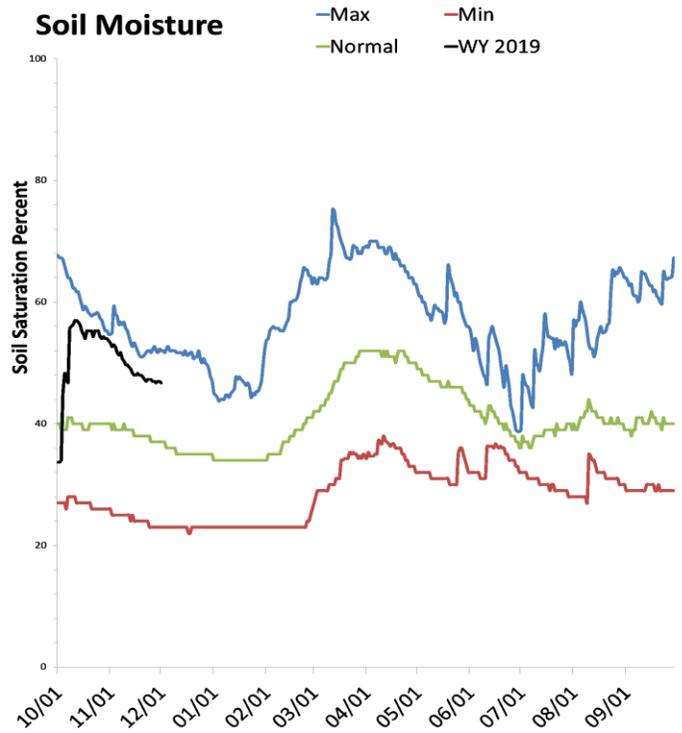

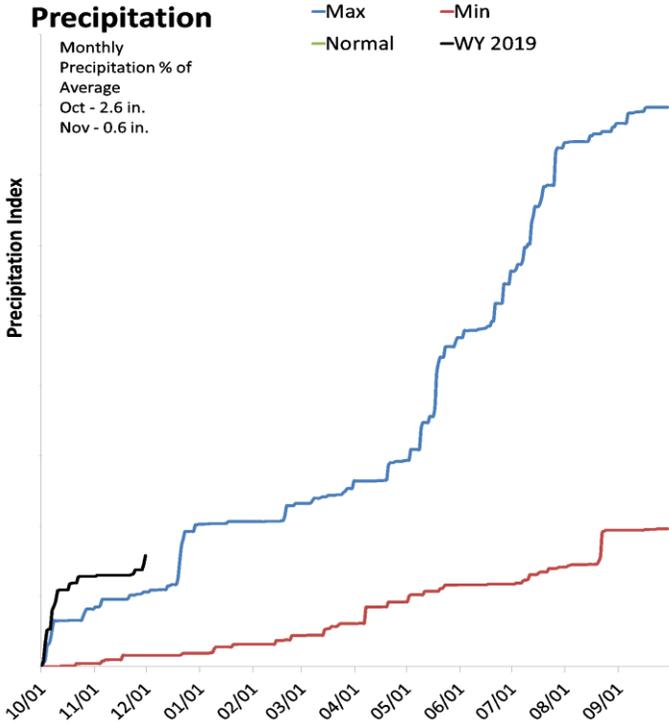

The average precipitation in November at SCAN sites within the basin was 1.1 inches, which brings the seasonal accumulation (Oct-Nov) to 3.4 inches. Soil moisture is at 29% compared to 43% last year.

# Uinta Basin

December 1, 2018

The average precipitation in November at SCAN sites within the basin was 0.6 inches, which brings the seasonal accumulation (Oct-Nov) to 3.2 inches. Soil moisture is at 47% compared to 32% last year.

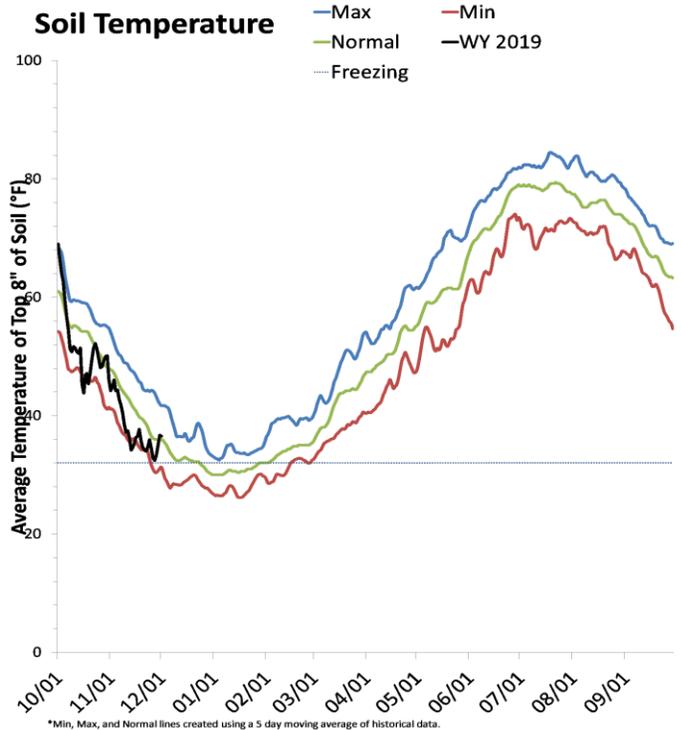

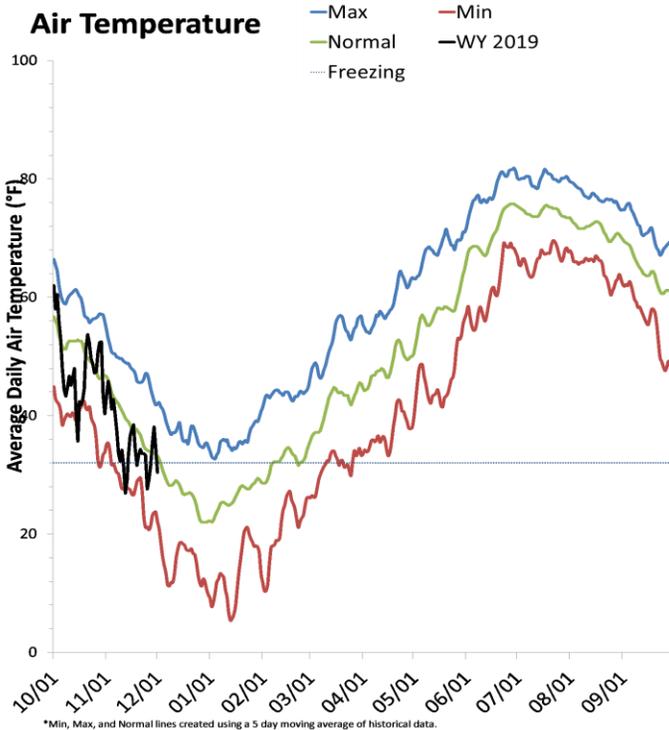

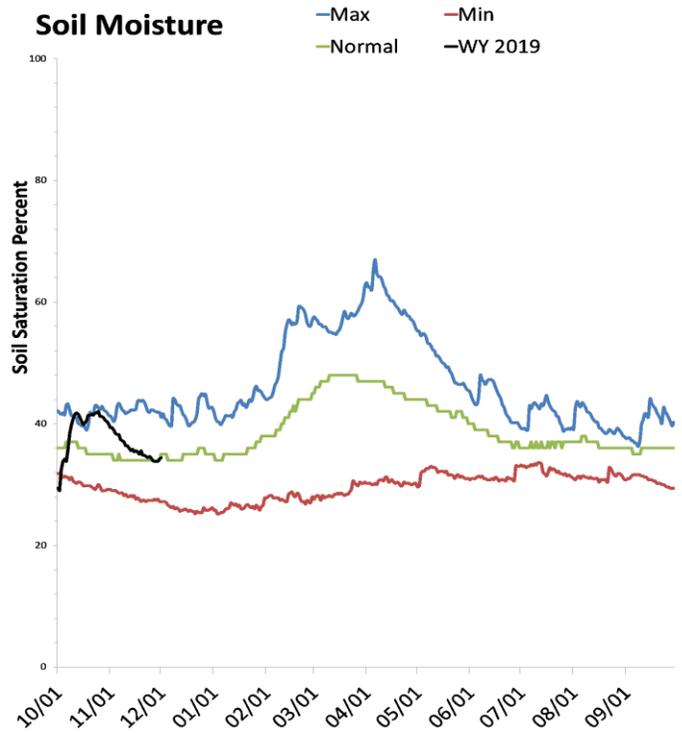

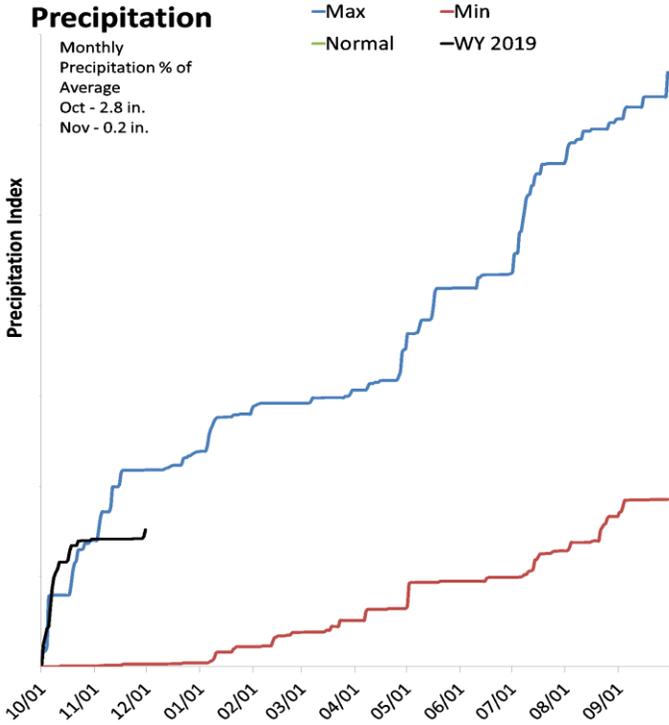

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

# Southeast

December 1, 2018

The average precipitation in November at SCAN sites within the basin was 0.2 inches, which brings the seasonal accumulation (Oct-Nov) to 3 inches. Soil moisture is at 35% compared to 30% last year.

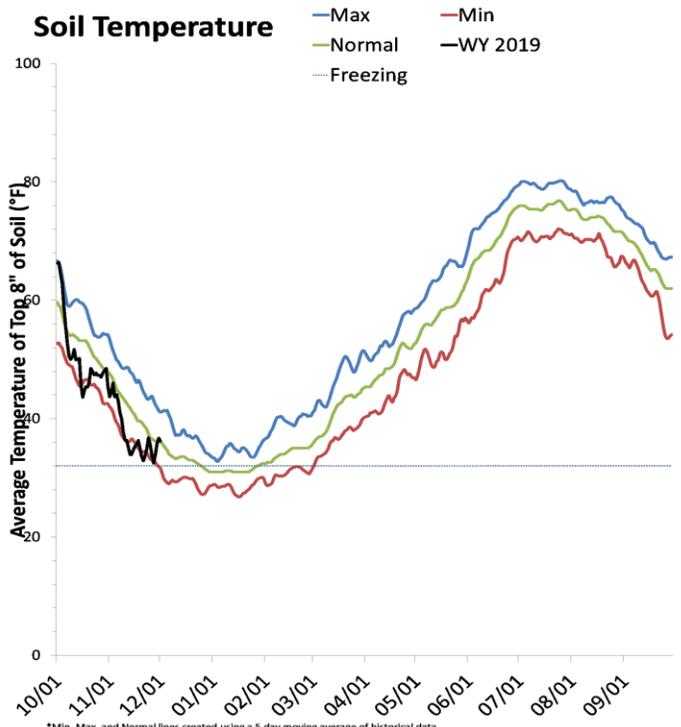

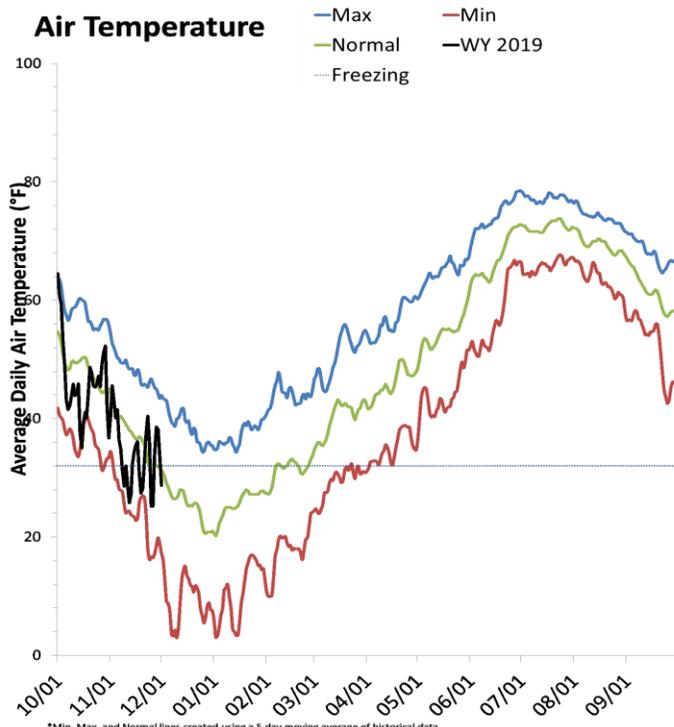

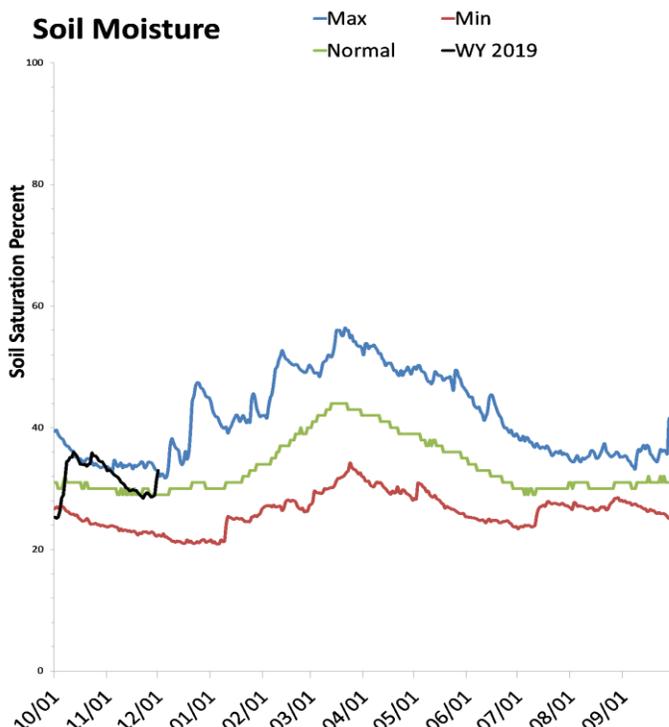

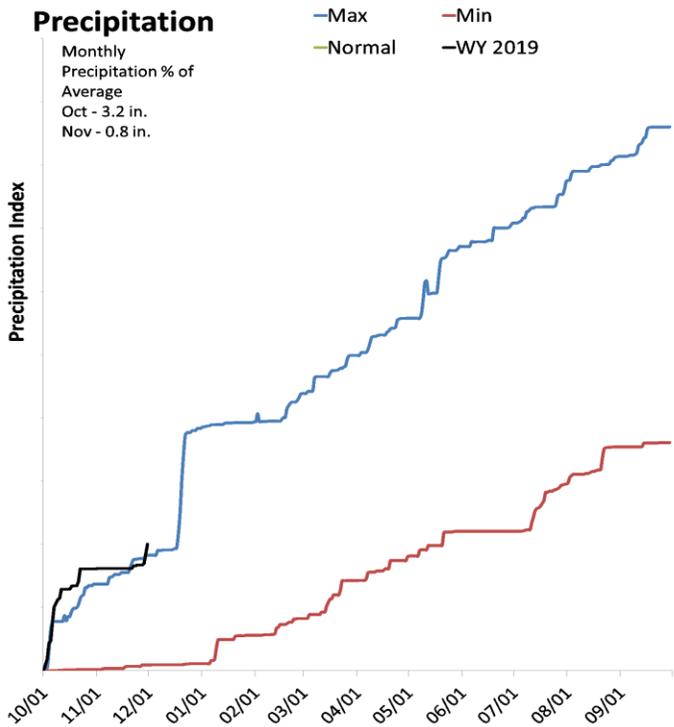

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

# South Central

December 1, 2018

The average precipitation in November at SCAN sites within the basin was 0.8 inches, which brings the seasonal accumulation (Oct-Nov) to 4 inches. Soil moisture is at 33% compared to 24% last year.

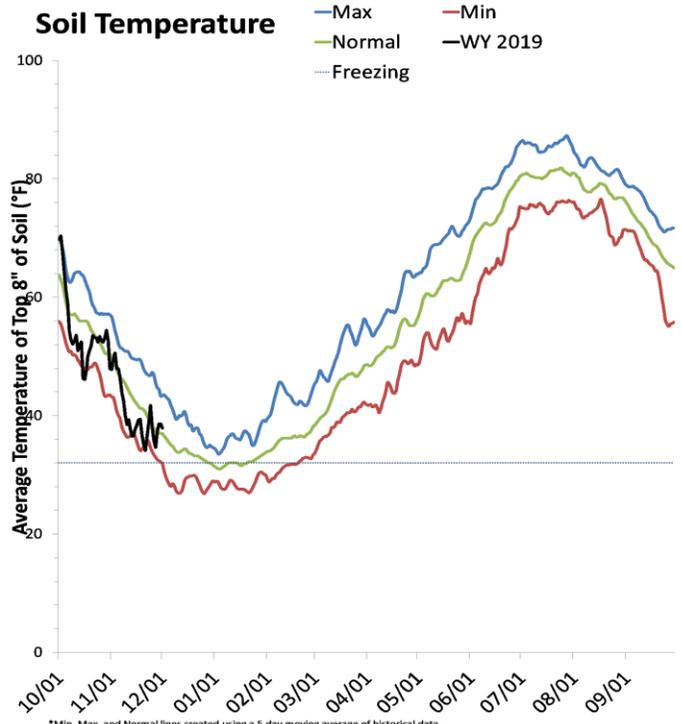

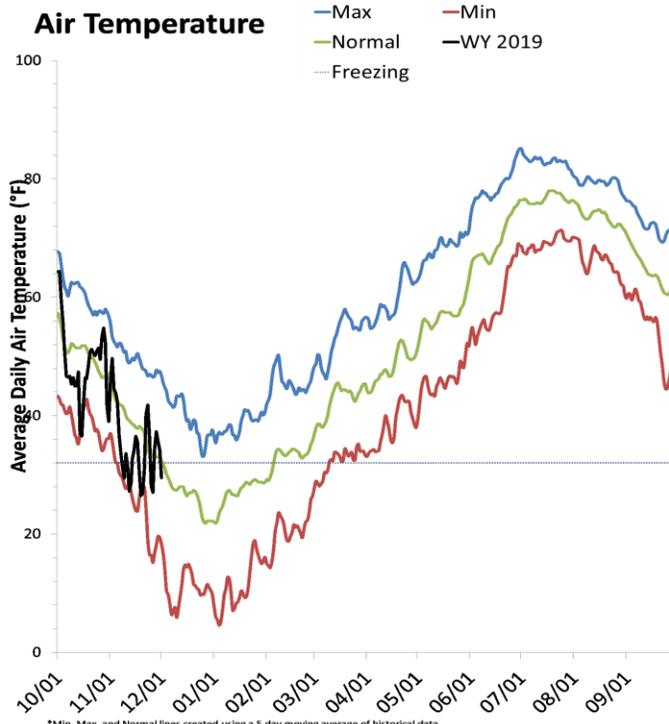

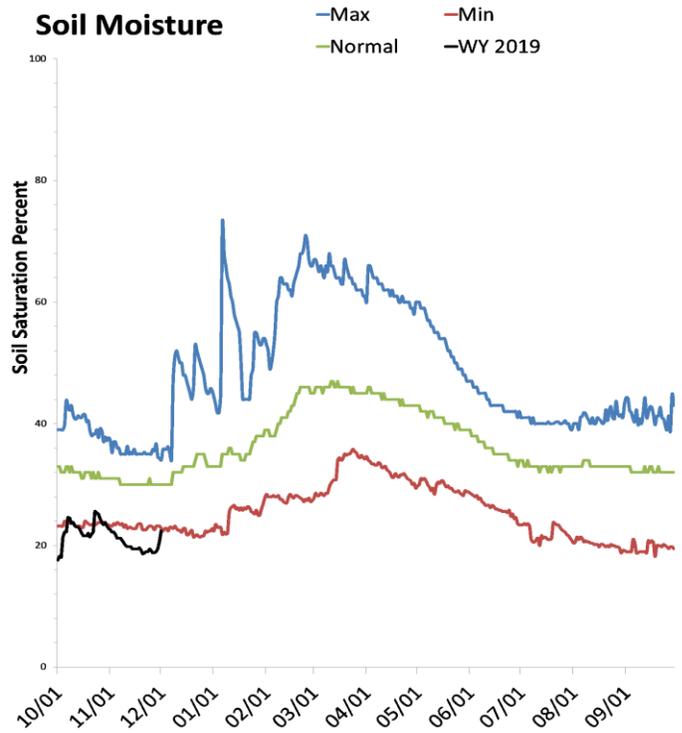

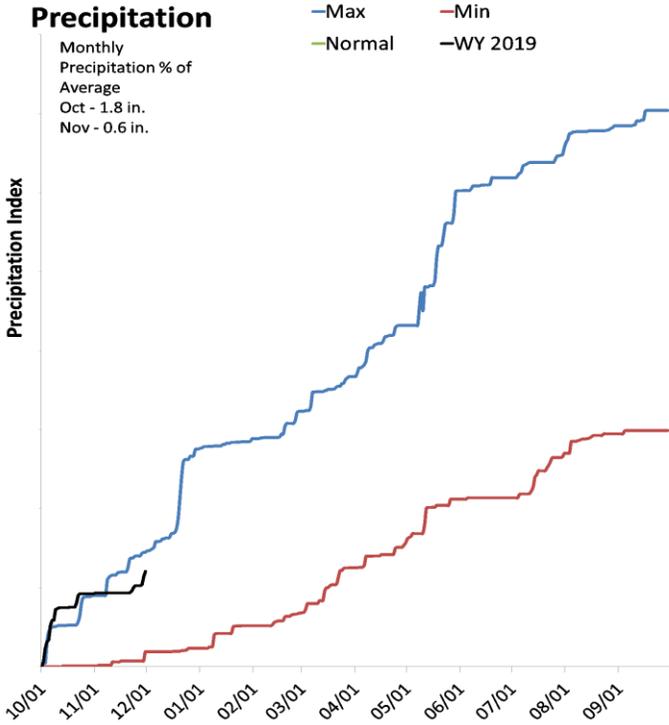

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

# Western and Dixie

December 1, 2018

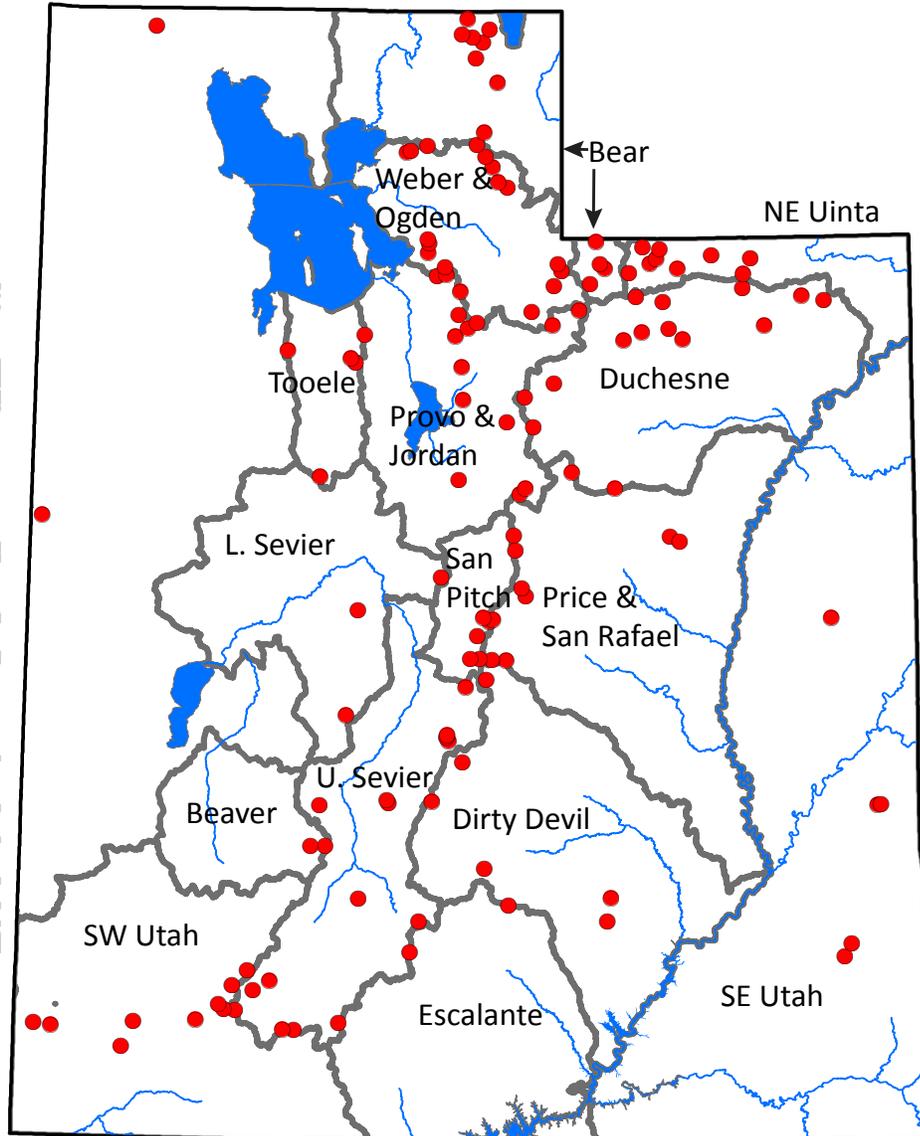

The average precipitation in November at SCAN sites within the basin was 0.6 inches, which brings the seasonal accumulation (Oct-Nov) to 2.4 inches. Soil moisture is at 22% compared to 23% last year.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

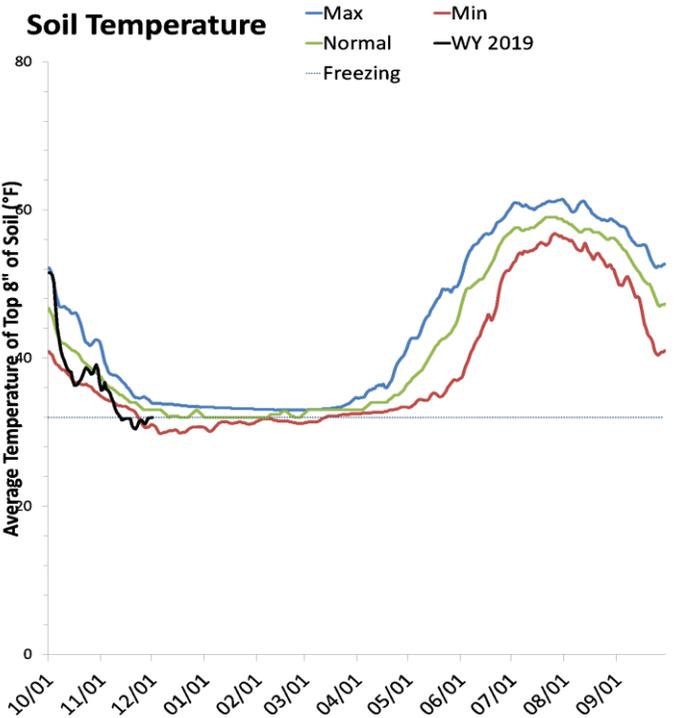

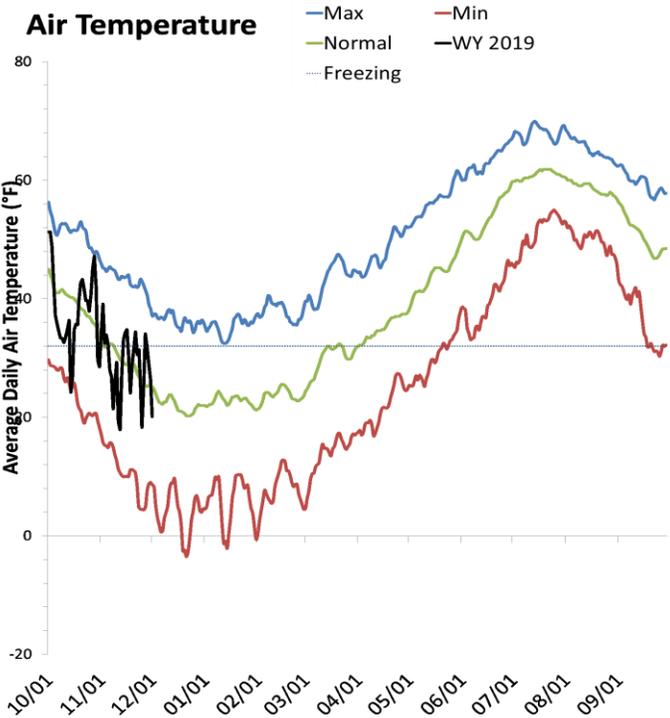

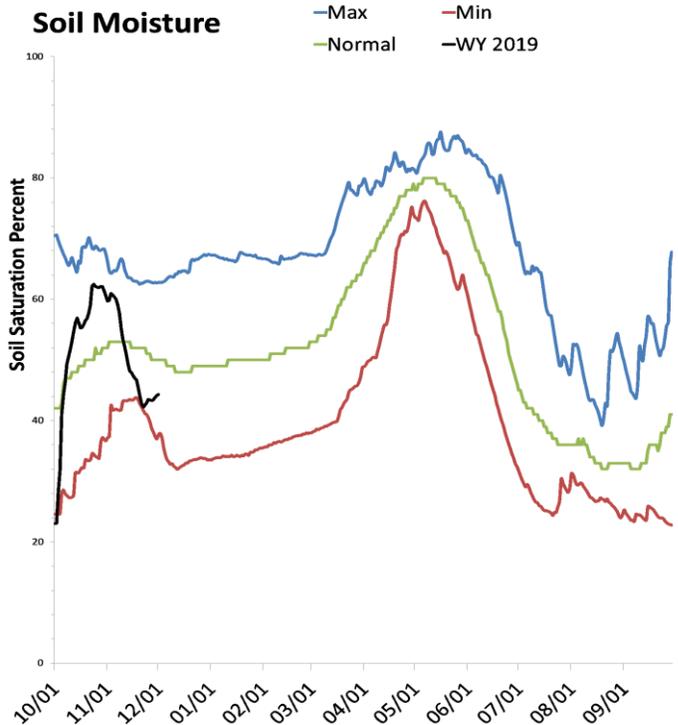

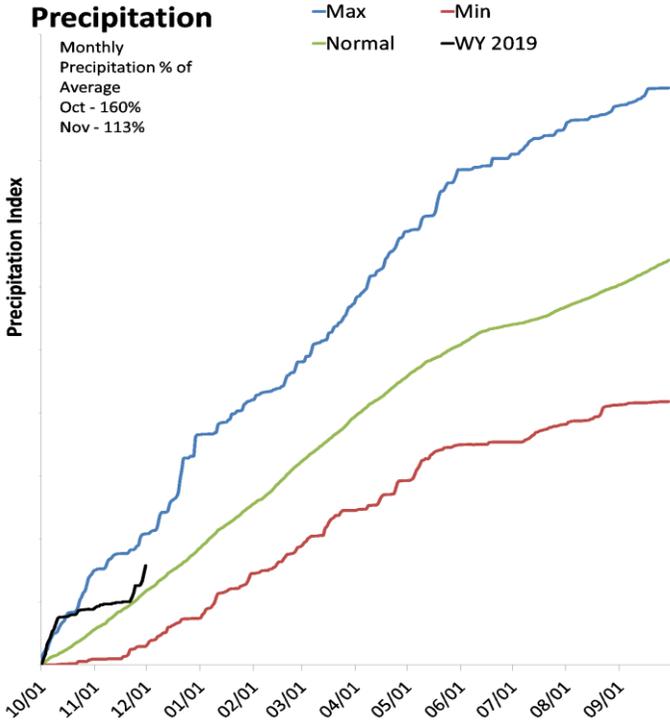

# SNOTEL portion of report

# Statewide SNOTEL

December 1, 2018

Precipitation at SNOTEL sites during November was above average at 113%, which brings the seasonal accumulation (Oct-Nov) to 135% of average. Soil moisture is at 44% compared to 52% last year. Reservoir storage is at 55% of capacity, compared to 71% last year.

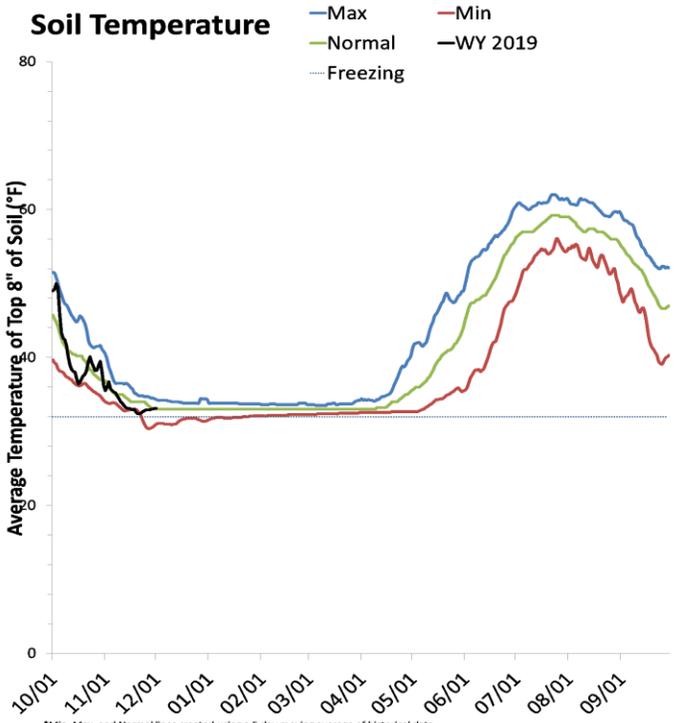

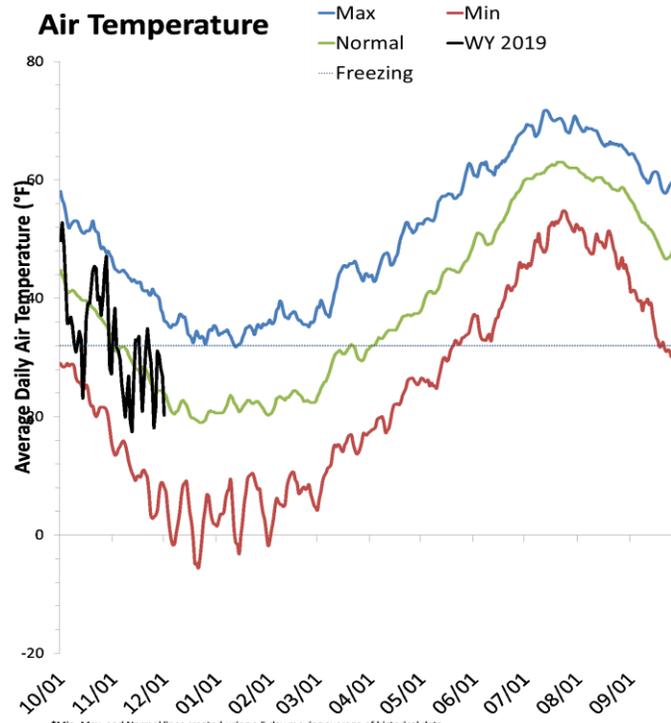

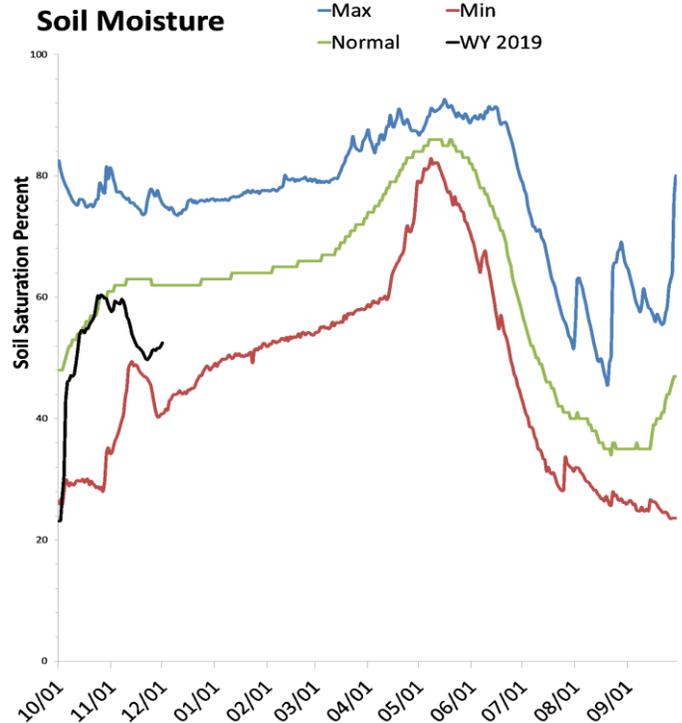

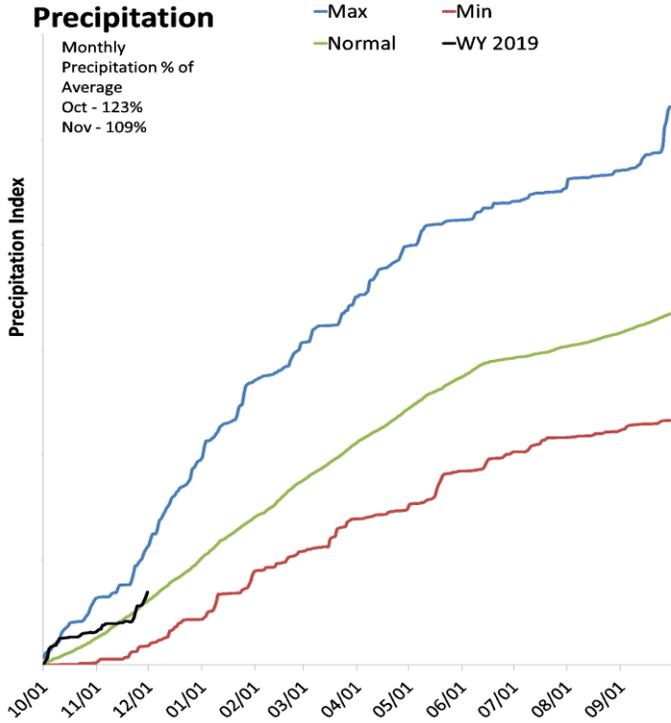

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

# Bear River Basin

December 1, 2018

Precipitation in November was near average at 108%, which brings the seasonal accumulation (Oct-Nov) to 114% of average. Soil moisture is at 52% compared to 76% last year. Reservoir storage is at 60% of capacity, compared to 81% last year. The water availability index for the Bear River is 69%, 36% for Woodruff Narrows and 52% for the Little Bear.

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

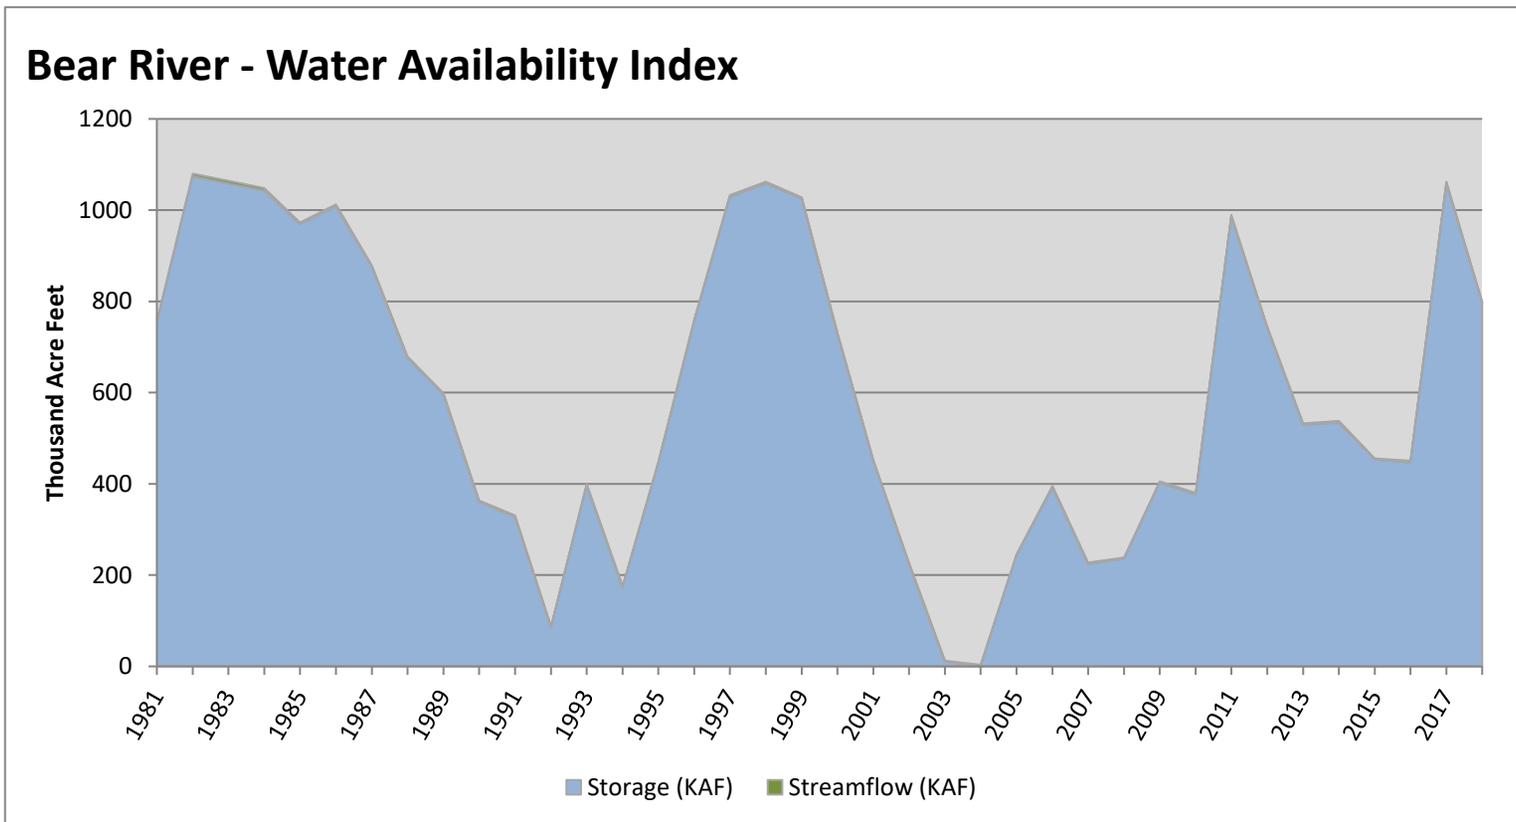

\*Min, Max, and Normal lines created using a 5 day moving average of historical data.

### What is a Water Availability Index?

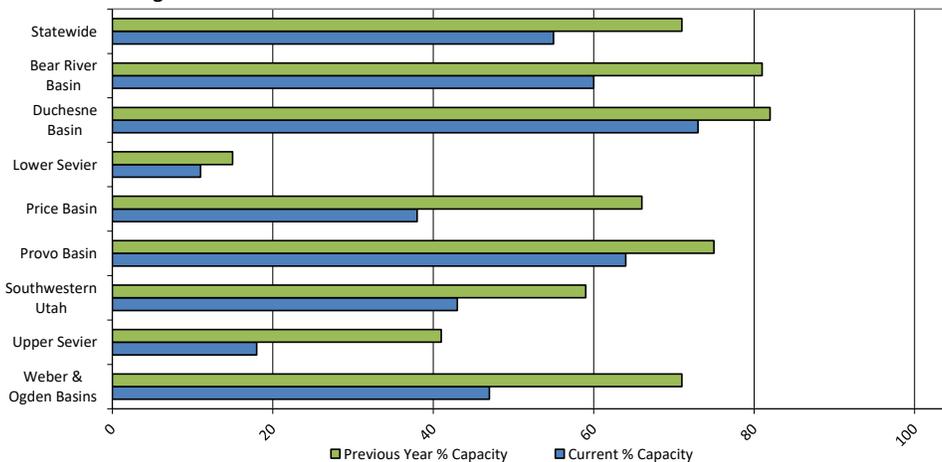

The Water Availability Index (WAI) is an observed hydrologic indicator of current surface water availability within a watershed. The index is calculated by combining current reservoir storage with the previous months streamflow. WAI values are scaled from +4.1 (abundant supply) to -4.1 (extremely dry) with a value of zero (0) indicating median water supply as compared to historical analysis. WAI's are calculated in this fashion to be consistent with other hydroclimatic indicators such as the Palmer Drought Index and the Precipitation index.

Utah Snow Surveys has also chosen to display the WAI value as well as a PERCENT CHANCE OF NON-EXCEEDANCE. While this is a cumbersome name, it has the simplest application. It can be best thought of as a scale of 1 to 99 with 1 being the drought of record (driest possible conditions) and 99 being the flood of record (wettest possible conditions) and a value of 50 representing average conditions. This rating scale is a percentile rating as well, for example a WAI of 75% means that this years water supply is greater than 75% of all historical events and that only 25% of the time has it been exceeded. Conversely a WAI of 10% means that 90% of historical events have been greater than this one and that only 10% have had less total water supply. This scale is comparable between basins: a SWSI of 50% means the same relative ranking on watershed A as it does on watershed B, which may not be strictly true of the +4 to -4 scale.

For more information on the WAI go to: [www.ut.nrcs.usda.gov/snow/](http://www.ut.nrcs.usda.gov/snow/) on the water supply page. The entire period of historical record for reservoir storage and streamflow is available.

<b>Reservoir Storage Summary for the end of November 2018</b>	Current (KAF)	Last Year (KAF)	Average (KAF)	Capacity (KAF)	Current % Capacity	Last Year % Capacity	Average % Capacity	Current % Average	Last Year % Average
