### Agricultural Non-Point Source Pollution Modeling System – Continuous Version

December 2019

#### Developers

U. S. Department of Agriculture, Natural Resource Conservation Service and Agricultural Research Service.

#### National Model Leaders

**Ron Bingner**, Agricultural Engineer, USDA-ARS-National Sedimentation Laboratory, 598 McElroy Dr., Oxford, Mississippi 38655. Information requests, copies of the model, and model documentation can be directed to the **AGNPS** WEB site at: <http://www.ars.usda.gov/Research/docs.htm?docid=5199> or contact Ron at 662-232-2966 (email: [Ron.Bingner@usda.gov](mailto:Ron.Bingner@usda.gov))

#### Description

The **AGNPS pollutant loading** (PL) modeling environment is comprised of several modules enabling users to develop appropriate input parameters for evaluations of best management practices using simulations for their watershed system. **AnnAGNPS** is the pollutant loading modeling module designed for risk and cost/benefit analyses. **AnnAGNPS** is the next generation of the **AGNPS 5.0** single event model developed by USDA. **AnnAGNPS** is a batch-process, continuous-simulation, surface-runoff, pollutant loading (PL) computer model written in standard ANSI Fortran 2015. The model was developed to simulate long-term runoff, sediment and nutrient transport from agricultural watersheds for conservation practices management planning. The basic modeling components are hydrology, sediment, nutrient, and pesticide transport. Land area (cell) geometric representations of a watershed are used to provide landscape spatial variability. Each cell homogeneously represents the landscape within the respective cell boundary, including the capability to distinguish sheet & rill erosion and ephemeral gully erosion and the impact of conservation practices, such as riparian buffers and wetlands on these processes. The physical or chemical constituents are routed from their origin within a cell and are either deposited within the stream channel system or transported out of the watershed. Pollutants can then be identified at their source and tracked as they move through the watershed system.

#### Uses

**AGNPS** can be used to evaluate the long term impact of non-point source pollution from agricultural watersheds. Effects of implementing various conservation management alternatives within the watershed can be evaluated. The loadings predicted are: (1) water; (2) sediment by particle size class & source of erosion; and (3) chemicals—nitrogen, phosphorus, organic carbon, & pesticides. PL's are generated from cells and routed through stream systems on a daily basis. Special land use components such as feedlots (nutrients), ephemeral and classic gullies (sediment and chemicals), point sources (water and nutrients), riparian buffers, and wetlands are included.

## Features

- Loading, transport, and tracking of pollutants from their source to the outlet or any other location within a watershed system.
- Ephemeral gully erosion can be simulated, separate from sheet & rill erosion.
- Nutrient concentrations from feedlots and other point sources can be simulated.
- Riparian buffers, wetland and prairie pothole effects can be derived anywhere in the watershed.
- An integrated interface allowing the automatic determination of cell boundaries, flow routing, ephemeral gully and channel properties, and riparian buffer, wetland, and pothole characterizations. This program utilizes topographic analysis tools using readily available DEM's.
- A graphical input data preparation editor facilitating data input and revisions.
- Tools to rapidly evaluate the contribution of pollutants throughout the watershed.
- Capabilities to execute programs in 32-bit or 64-bit operating systems.
- Advanced channel evolution and stream corridor restoration capabilities provided through the enhanced integration with **CONCEPTS**.
- RUSLE2 erosion science integration.

## System Requirements

**AGNPS** is expected to run on any PC (Pentium or higher) under Windows XP, 7, 8, or 10. Actual memory requirements are dependent upon the number of cells selected. A practical minimum memory limit would be 2GB for user data entry and **AnnAGNPS** execution.

## Planned Developments

The following components are planned as enhancements to **AGNPS**:

- Lake water quality components.
- Integration of NEXRAD technology.
- Land-atmosphere exchanges needed for global climate change evaluations.
- Enhanced organic carbon components.
- Continued enhancements of ephemeral gully, buffer and wetland components.
- Enhanced snowfall, snowmelt, and soil temperature capabilities.

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, and marital or familial status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotope, etc.) should contact the USDA Office of Communications at (202) 720-5881 (voice) or (202) 720-7808 (TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, DC 20250, or call (202) 720-7327 (voice) or (202) 720-1127 (TDD). USDA is an equal employment opportunity employer.
